## *Shingrix Immunization*

In October 2017, the federal government's Advisory Committee on Immunization Practices (ACIP) voted to recommend Shingrix for protection against shingles caused by the varicella zoster virus for adults 50 years and older. Shingrix is a new recombinant and adjuvanted vaccine that is given in a 2-part series given initially and then again in 2-6 months. Shingles occurs when the chickenpox virus (varicella zoster) reactivates later in life. Almost all adults older than 40 years old carry the chickenpox virus, and as we get older, the higher the risk is of developing shingles. The new vaccine has been shown to prevent shingles over 90% of the time for most patients!
